Background

Healthcare Quality Reporting Program

Mission

To promote quality in the state's healthcare system by developing a healthcare quality performance measures and reporting program to guide quality improvement initiatives.

Reporting Process

Aggregate Report

2017 HIT Survey State of Rhode Island Department of Health

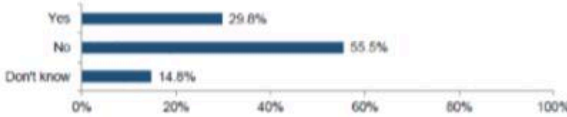

Incentive Programs and Alternative Payment Models

Many of the new incentive programs and alternative payment models rely on or evaluate use of an EHR for documentation or quality reporting. For many physicians, these new models and programs will require significant changes to their workflow, including how they use EHRs and other technology.

The 2017 Health Information Technology (HIT) Survey measured the percent of Rhode Island physicians whose main practice site is a Patient Centered Medical Home (PCMH). The PCMH model aims to provide comprehensive, coordinated, patient-centered, accessible, and quality care. In Rhode Island, 29.8% of office-based physicians reported that their main practice site is a PCMH (Figure 19, page 21).

To learn more about the PCMH model of care, visit: <https://www.pcmh.ahrq.gov/page/defining-pcmh>

Figure 19. Percent of office-based physician respondents whose main practice site is a Patient-Centered Medical Home (PCMH) (N=1,166)

Response	Percentage
Yes	29.8%
No	55.5%
Don't know	14.8%

2017 HIT Survey State of Rhode Island Department of Health

among physicians in Rhode Island

Odds Ratio	95% Confidence Interval	P
ref	ref	ref
2.5	1.9 - 3.3	< 0.001
ref	ref	ref
1.9	1.4 - 2.6	< 0.001
ref	ref	ref
0.9	0.6 - 1.3	n.s.
1.8	1.3 - 2.4	< 0.001

documentation, EHR-related frustration, and time spent on electronic health record; ref = reference group; n.s. = not significant

Survey revealed that 46% of U.S. physician respondents reported at least one symptom of physician burnout. In Rhode Island, trained professionals who assist with documentation, may mitigate HIT-related frustration. In Rhode Island, 11% of physician respondents reported using a scribe (office-based = 9.8%; hospital-based = 12.5%).

Methods

2019 administration

- Via Survey Monkey in May 2019
- Hard copy mailing with survey link, email if possible
- All clinicians with RI licenses
- In active practice, providing direct patient care
- 4,539 physicians & 1,977 advanced practice providers

E-Prescribing Practices & Use of the PDMP

e-Prescribing

Among physician respondents who prescribe medications, the percent who transmit prescriptions electronically to the pharmacy

e-Prescribing controlled substances

Among the physicians who e-prescribe medications and prescribe controlled substances, the respondents who e-prescribe controlled substances

New law for controlled substances

59% of physicians who prescribe controlled substances *are not* transmitting them electronically

Physicians must transmit all controlled substance prescriptions electronically by **January 2, 2020**

Barriers to e-prescribing controlled substances

Frequency of responses

- Computer system not capable
- Prefer paper prescriptions
- Pharmacy requires paper prescriptions
- Did not know it was legal in RI
- Too few of these prescriptions
- System too expensive
- System too complicated

Key findings

- E-prescribing **high overall** in Rhode Island, but has **plateaued** in recent years
- Less consistent use among hospital physicians
- **Work to be done** for universal e-prescribing of controlled substances by 2020

PDMP use in the office

PDMP use in the hospital

(N=333)

Barriers to PDMP use

Frequency of responses

- Separate login
- Time consuming/slow
- Interrupts workflow
- Rarely prescribe these
- Remembering/frequently-changing password
- Complex process
- Practice in other states (e.g., use MA version)

Key findings

- PDMP **use varies** by setting, specialty, scenario
- PDMP use **higher than 2017** across both settings
- Most common PDMP barriers relate to perception of system as **cumbersome**

Impact of EHRs on Physicians

Do EHRs help?

Time Spent on the EHR at Home

Circumstances when use EHR remotely

Response	Office-based (n=810)	Hospital- based (n=265)	Overall (N=1,075)
Unable complete work during regular office or clinical hours	70.0%	52.1%	67.4%

Circumstances when use EHR remotely

Response	Office-based (n=810)	Hospital- based (n=265)	Overall (N=1,075)
Unable complete work during regular office or clinical hours	70.0%	52.1%	67.4%
On call	68.3%	57.6%	60.0%

Circumstances when use EHR remotely

Response	Office-based (n=810)	Hospital- based (n=265)	Overall (N=1,075)
Unable complete work during regular office or clinical hours	70.0%	52.1%	67.4%
On call	68.3%	57.6%	60.0%
To prepare for patient visits or encounters in advance	39.7%	33.2%	37.2%

Circumstances when use EHR remotely

Response	Office-based (n=810)	Hospital- based (n=265)	Overall (N=1,075)
Unable complete work during regular office or clinical hours	70.0%	52.1%	67.4%
On call	68.3%	57.6%	60.0%
To prepare for patient visits or encounters in advance	39.7%	33.2%	37.2%
When I have the opportunity to work at home instead of the office or hospital (i.e., to adjust my work/life balance)	35.2%	25.8%	29.9%

Circumstances when use EHR remotely

Response	Office-based (n=810)	Hospital- based (n=265)	Overall (N=1,075)
Unable complete work during regular office or clinical hours	70.0%	52.1%	67.4%
On call	68.3%	57.6%	60.0%
To prepare for patient visits or encounters in advance	39.7%	33.2%	37.2%
When I have the opportunity to work at home instead of the office or hospital (i.e., to adjust my work/life balance)	35.2%	25.8%	29.9%
Away on vacation	32.1%	16.6%	27.7%

Time Spent on Inbox Tasks

Physicians who spend a moderately high or excessive amount of time on inbox tasks

Time Spent on Inbox Tasks

Physicians who spend a moderately high or excessive amount of time on inbox tasks

Physical challenges due to using HIT

Key findings

- Perception that **EHRs do improve some** physician work: billing, communication among staff, safety
- EHRs do NOT improve **job satisfaction**
- Remote EHR use because not able to **complete their work** at work
- Office-based physicians spend a large amount of time on **inbox tasks**
- Perception that HIT use linked with **physical challenges**

Physician Burnout & HIT Related Stress

Three questions:

- The EHR adds to the frustration of my day
- Amount of time I spend on the EHR at home
- Sufficiency of time for documentation

Burnout and
HIT-related
stress questions
were borrowed
from the
validated Mini z

Physicians with EHRs

EHR adds to
frustration of
my day

Moderately high
or excessive
EHR at home

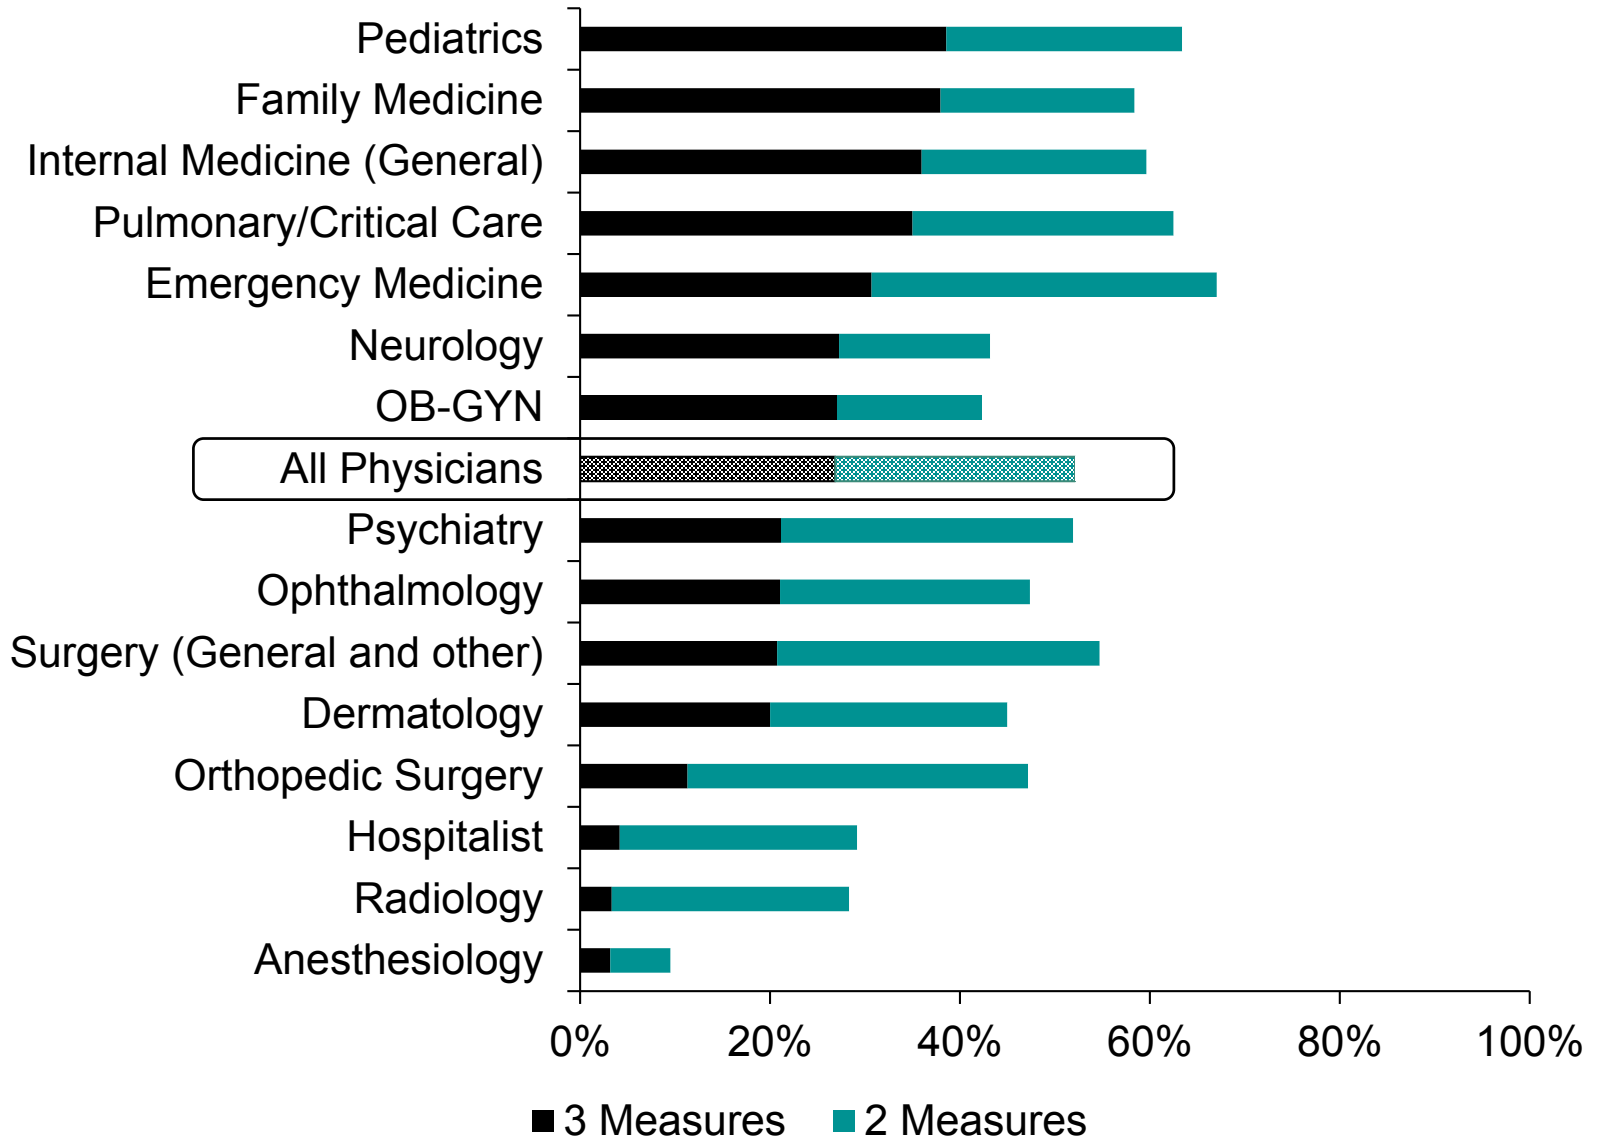

Insufficient
time for
documentation

HIT-related stress by specialty

HIT-related stress by specialty

HIT-related stress by specialty

Stressful features of HIT

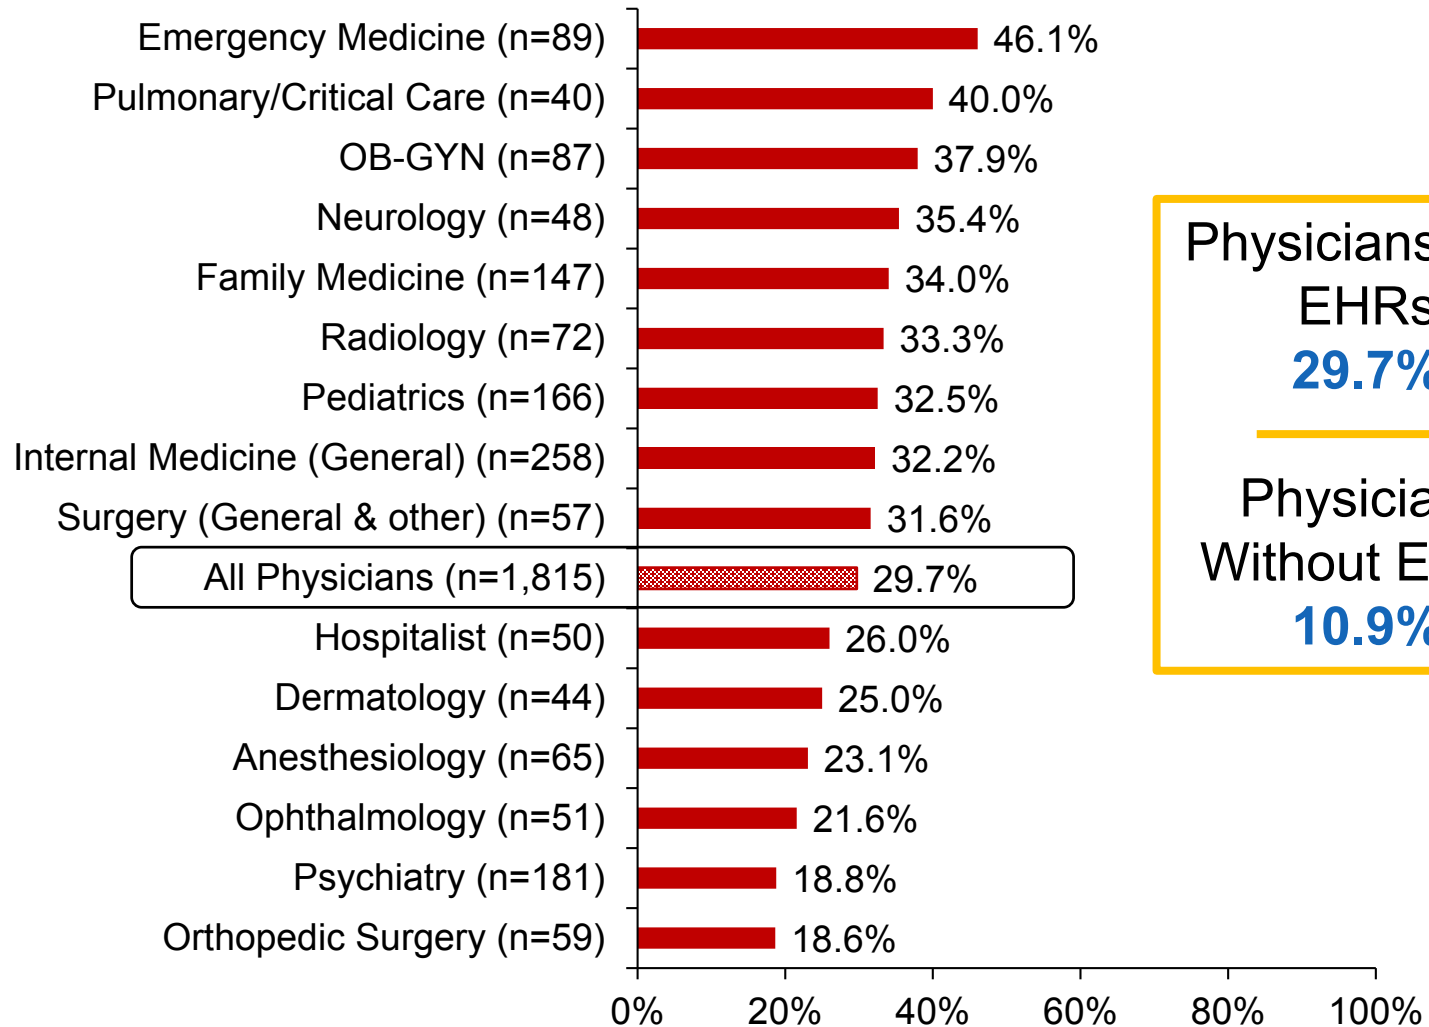

Stressful features of HIT

Frequency of responses

- Number of clicks to accomplish a task
- Lack of interoperability between systems
- Note bloat
- Fear of missing information due to volume of information in note
- Impact on interaction with patient
- Effect on productivity

Burnout symptoms by specialty

Adjusted Odds of Burnout

Measure	Odds Ratio	95% Confidence Interval	<i>p</i>
Sufficiency of Time for Documentation			
Sufficient	ref	ref	ref
Insufficient	3.7	2.8-4.7	<0.001
EHR Adds to Daily Frustration			
No	ref	ref	ref
Yes	2.3	1.7-3.1	<0.001
Time Spent on the EHR at Home			
Minimal/None	ref	ref	ref
Modest/Satisfactory	1.1	0.8-1.5	<i>n.s.</i>
Moderately High/Excessive	1.2	0.9-1.5	<i>n.s.</i>

Key findings

- HIT-related stress is **measurable and common**
- Prevalence = **81%** among physicians with EHRs
- There are many features of HIT that physicians find stressful, especially the **number of clicks**
- Presence of any of HIT-related stress measures independently **predicts burnout**
- EHRs important but **not entirely to blame**
- Organizations should **measure** HIT-related stress and burnout among workforce

Specialty matters

HIT-related stress is most prevalent in primary care oriented specialties

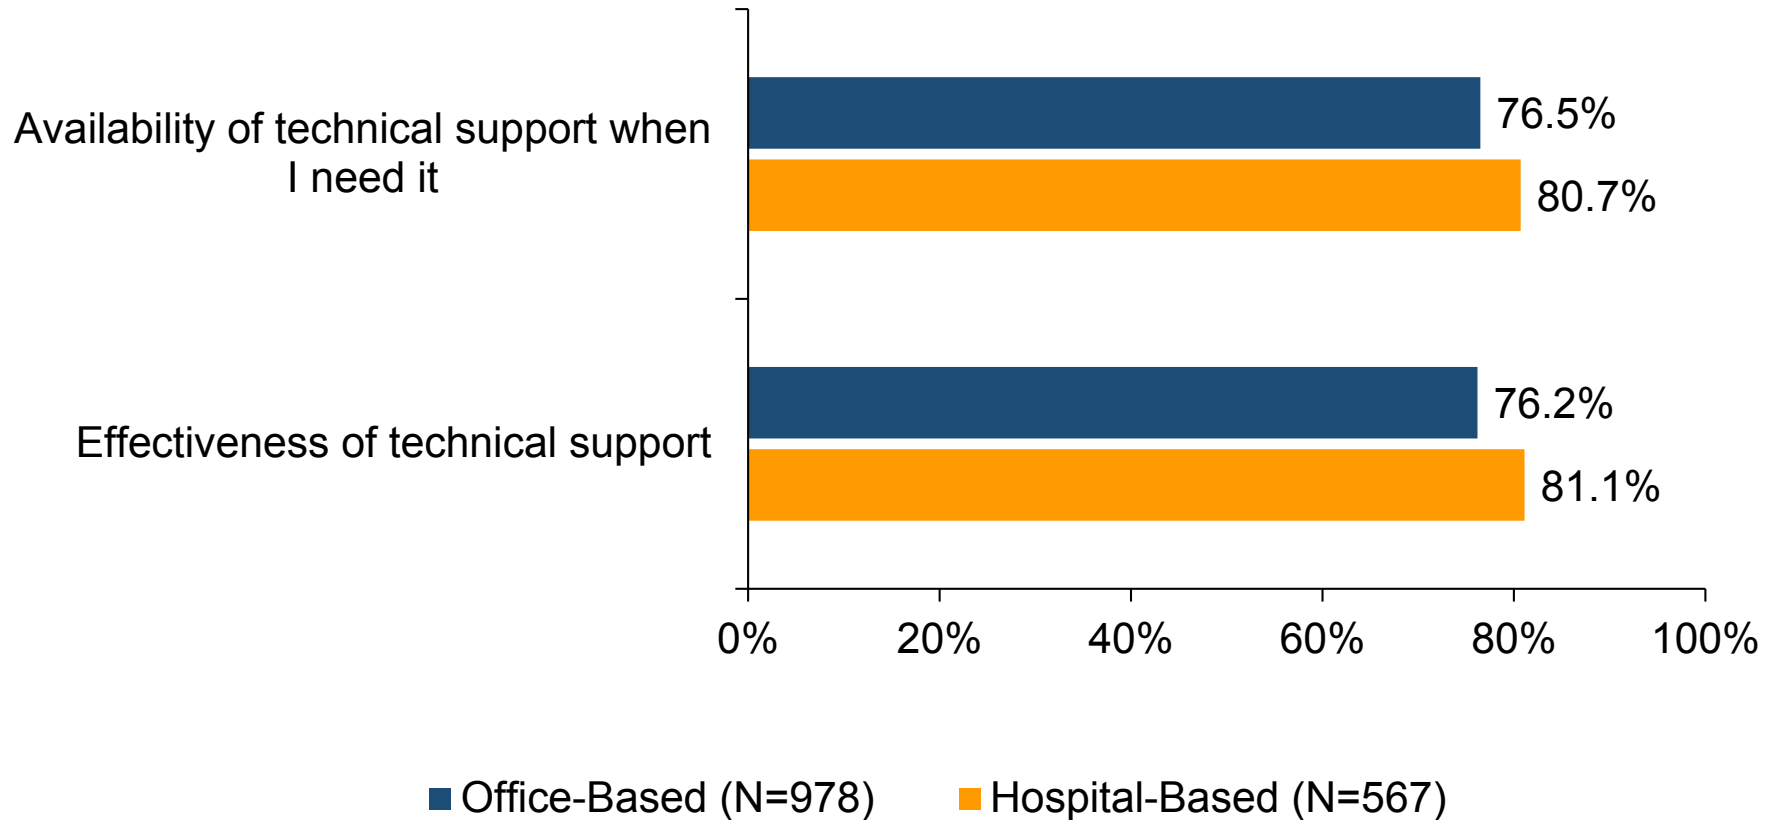

Lowest in hospital medicine and anesthesia

Strategies & Support for Reducing HIT-Related Stress

Technical Support

Support with Inbox Tasks

How often physician respondents receive assistance from someone in their practice in managing their inbox tasks

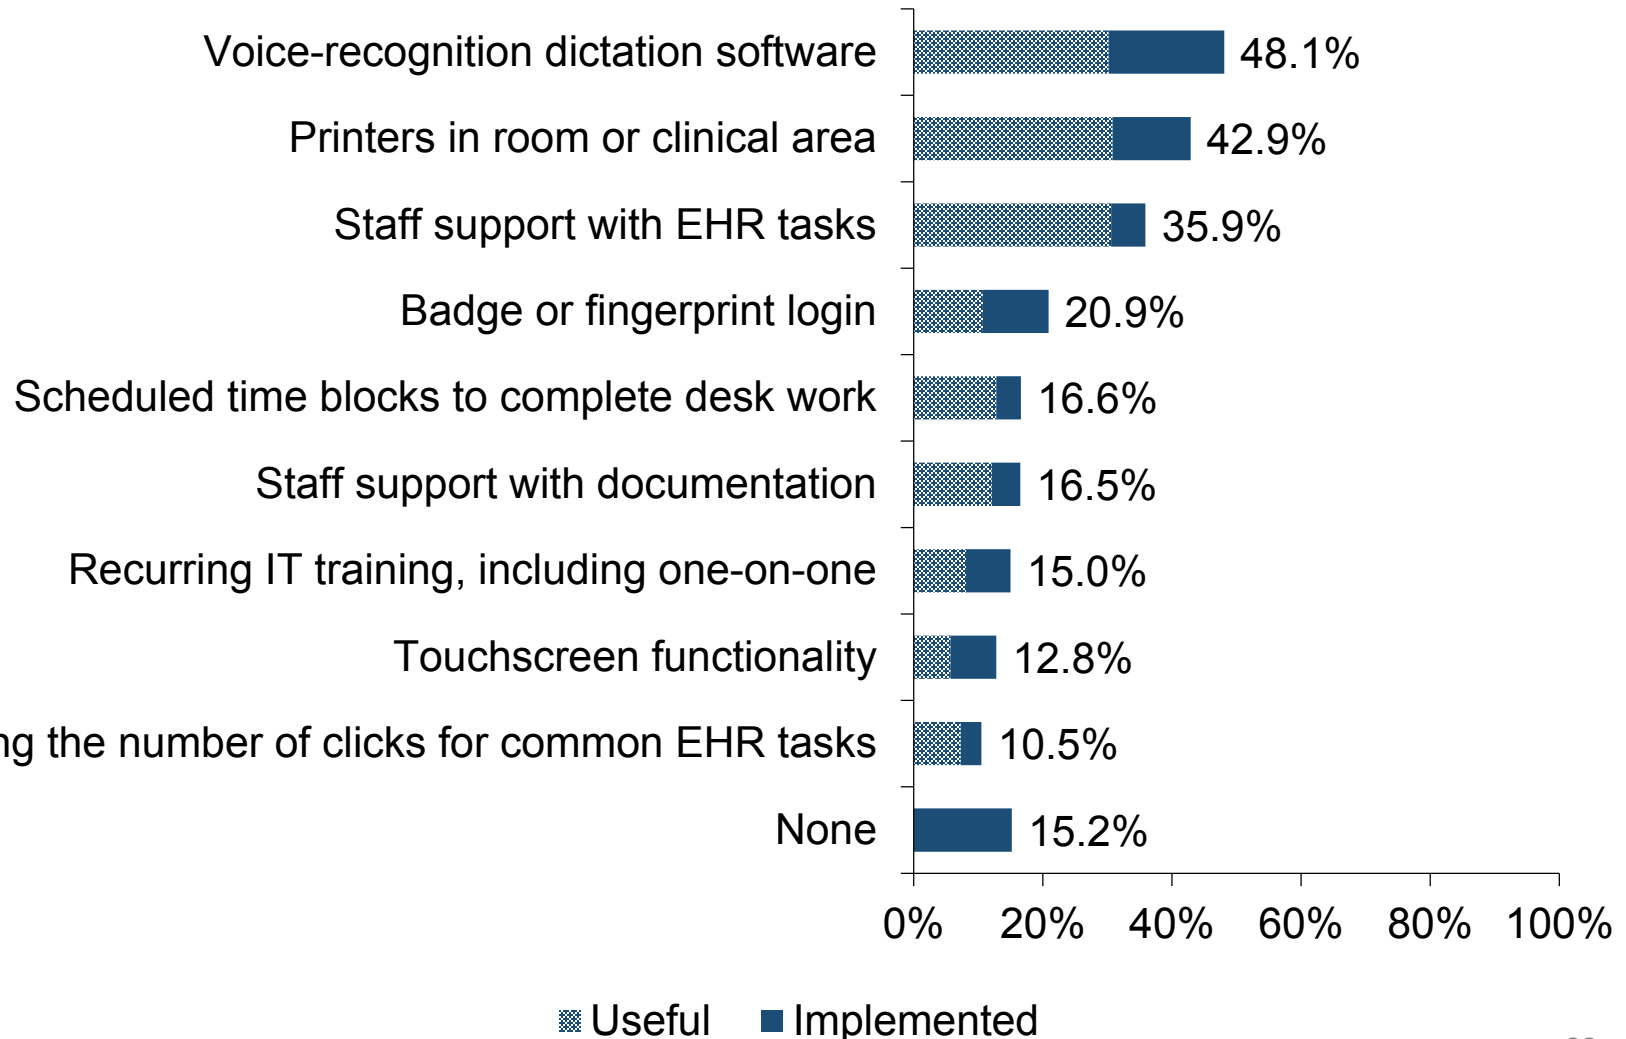

Moderately high or excessive time on inbox tasks:

Office-based
62.2%

Hospital-based
40.4%

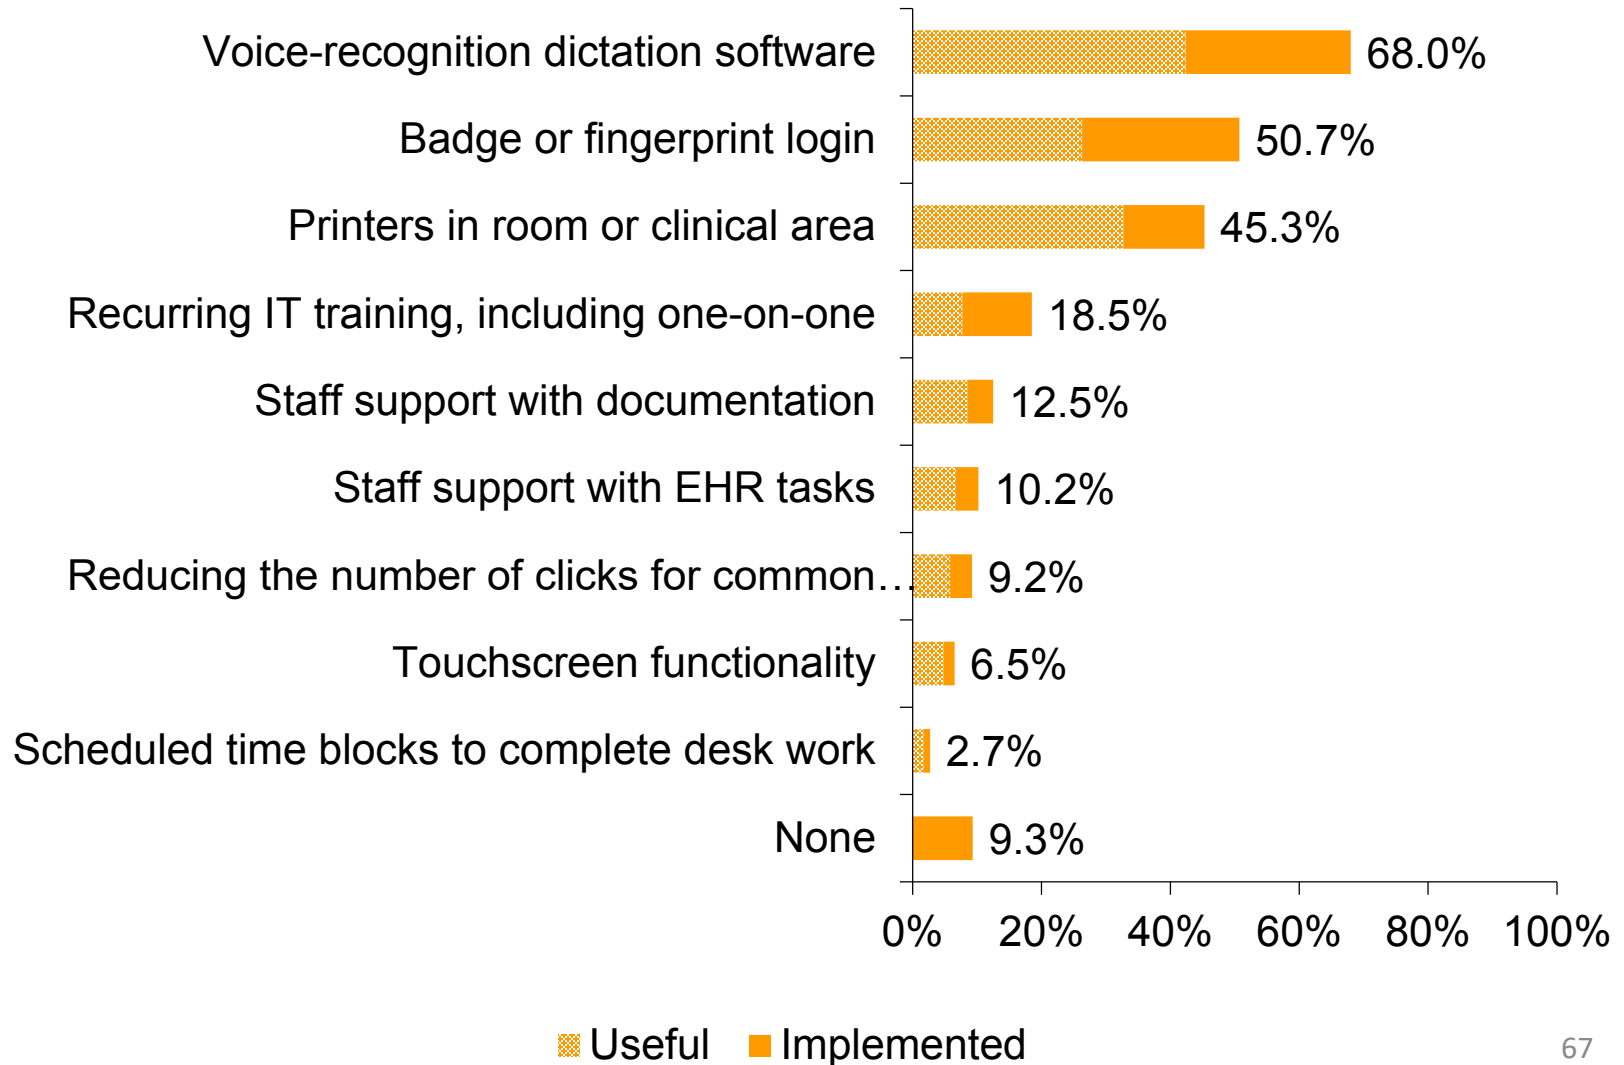

Practice changes to improve experience

Prescribing practitioners in Rhode Island are required to check the PDMP prior to initiating an opioid prescription. This includes inpatient practitioners who prescribe an opioid on discharge.

<http://sos.ri.gov/documents/archives/negd/ocs/released/pdf/DOH9054.pdf>

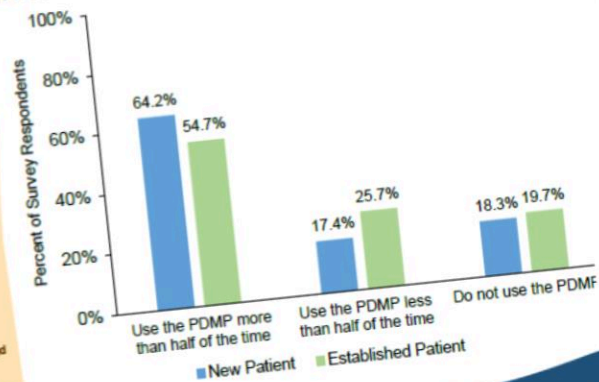

About the HIT Survey

In spring 2017, the Rhode Island Department of Health (RIDOH) administered the Health Information Technology (HIT) Survey to all 4,197 physicians licensed in Rhode Island, in active practice, and located in Rhode Island, Connecticut, or Massachusetts. The survey received a total of 1,792 responses, for a response rate of 42.7%.

EHR and e-prescribing trends in Rhode Island, 2009 to 2017

The percent of office-based physicians who consult the PDMP for new opioid or benzodiazepine prescriptions

Impact of prior surveys

- Alignment of HIT measures
- Guidance for allocation of state HIT resources
- Data for state grant applications
- Public use dataset for further research
- Fewer physician surveys overall

Action taken

- Solicit formal recommendations from primary care advisory group
- Improve education about new PDMP regulations
- Make PDMP accessible without separate login
- Make HIE accessible without separate login
- Connect physicians with help on HIE and QPP

Survey limitations

- Response rate and administration in single state may affect generalizability
- Not anonymous, administered by Department of Health, burnout prevalence may be underestimate
- Administered electronically, those uncomfortable with computers may be less likely to respond
